HCC Program

A New Solution For Clinical Documentation

Hospitalists are an extremely efficient mechanism to ensure capture of HCCs for hospitalized patients through comprehensive documentation and recording of relevant ICD-10 codes on their professional services claims. In addition, hospitalists are more reliable, less expensive, and less risky than home health visits or retrospective chart reviews.

In this case study, you will get insight into the goals of our HCC Recapture Program as well as proven results that lead to reproducible outcomes.

HCC Recapture Case Study

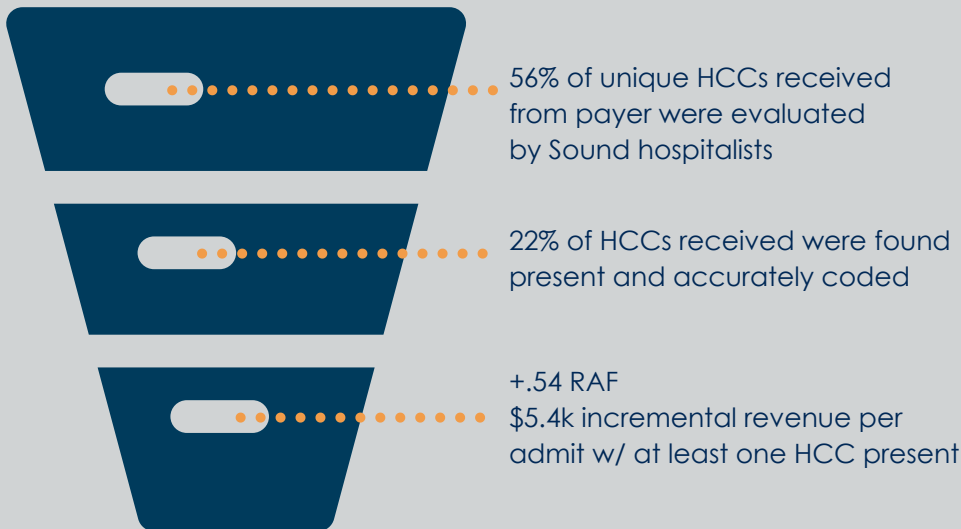

The Challenge

- The average risk adjustment factor for hospitalized members is 1.7x that of non-hospitalized members
- Studies have shown that ~33% of hospitalized members don't have an annual PCP visit
- Certain HCCs can only be captured in the hospital such as AMI, stroke, and sepsis
- Some chronic diseases are missed due to patients not seeing their PCP

The Solution

Sound hospitalists, who undergo extensive online and in-person training, engage patients to address gaps in documentation and capture HCCs only found in the inpatient setting. With Sound's expertise in changing clinician behavior over time, we are able to show our hospitalists the importance of clinical documentation and how it improves patient outcomes.

The Results

Fast Facts

The largest volume of HCCs coded was in Q4 of 2020

92% of HCCs addressed were for chronic diseases

Learn More

Sound hospitalists can reach a significant portion of your sickest member population not addressed by your primary care providers.
